Comparison of whole genome sequences of Chlamydia pneumoniae J138
from Japan and CWL029 from USA
Nucleic Acids Res. 28 (12), 2311-2314 (2000)
Shirai, M. Direct Submission Submission Construct Submission Shirai, M. Shirai, M. Submitted (04-UDL-2000) to the DDBJ/EMBL/GenBank databases. Mutsunori Shirai, Yamaguchi University School of Medicine, Mutsunori Shirai, Yamaguchi University School of Medicine, Department of Microbiology; 1-1-1 Minamikogushi, Ube, Yamaguchi 155-5856, Japan (E-mail:mshirai@po.cc.yamaguchi-u.ac.jp, Tel:81-836-22-227, Fax:81-836-22-2415) On Sep 15, 2000 this sequence version replaced gi:6172398 gi:61
 Chlamydophila pneumoniae J138 genomic DNA, complete sequence,
 pneumoniae (strain J138)"
 section 3/4.

```
This DNA sequence codes for the major outer membrane protein (MOMP, see AAW98187) of Chlamydia psittaci strain 6BC. Claimed MOMP polypeptides (see AAW98183 and AAW98184) comprise regions VD3 and VD4 of an MOMP, i.e. they lack regions VD1 and VD2. Claimed vaccine compositions include such MOMP polypeptides, optionally fused to a maltose binding protein. Also claimed are isolated nucleic acids encoding the polypeptide, a vector, and a method of preventing C.

 for the major outer membrane protein (MOMP,
 This DNA sequence codes for the major outer membrane protein (MOMP see AAW98187) of Chlamydia psittaci strain B577. A claimed MOMP by Orperlide (see AAW98184) comprises regions VD3 and VD4 of MOMP.

i.e. it lacks regions VD1 and VD2. A claimed vaccine composition includes the MOMP polypeptide, optionally fused to a maltose binding protein. Also claimed are an isolated nucleic acide concoding the polypeptide, a vector, and a method of preventing C. psittaci infection by administering the vaccine containing the MOMP polypeptide. Vectors encoding MOMP polypeptides lacking regions VD1 and VD2 are useful for genetic vaccination. The vaccines are used to prevent C. psittaci infection, especially in

This DNA sequence codes for the major outer membrane protein (MOMP, see AAW98187) of Chlamydia psittaci strain LSUWTCK, a cockatiel isolate (the MOMP gene sequence of this isolate is identical to that of C. psittaci Avian Type C). A claimed MOMP polypeptide (see AAW98183) comprises regions VD3 and VD4 of MOMP, i.e. it lacks regions VD1 and VD2. A claimed composition includes MOMP colypeptide lacking VD1 and VD2. Optionally fused to a maltose binding protein. Also claimed are an isolated nucleic acid encoding the polypeptide, a vector, and a method of preventing C. Constitution in the polypeptide. Vectors encoding MOMP polypeptides lacking regions VD1 and VD2 are useful for genetic vaccination. The vaccines are used to prevent C. psittaci infection, especially in

The present invention relates to new nucleic acid sequences and the proteins encoded by the nucleic acid sequences. The encoded proteins comprise an immunogenic portion of a Chlamydia antigen. The encoded proteins are useful for the serodiagnosis and treatment of Chlamydia infection. Chlamdiae are intracellular bacterial pathogens that are responsible for a wide variety of human infections. C. trachomatis infection is one of the most common sexually transmitted diseases and can and infertility. Trachoma due to ocular infection with C. trachomatis is the leading cause of preventable blindness worldwide. C. pneumonia is a major cause of acute respiratory tract infections in humans and is also thought to play a role in the pathogenesis of atherosciencia.
 The present sequence is a nucleic acid sequence
 Isolated polypeptide for diagnosis and treatment of Chlamydia infection comprises immunogenic portion of Chlamydia antigen, which comprises amino acid sequence encoded by polynucleotide sequence

Chlamydia polypeptides and fusion proteins useful for preventing pelvic inflammatory disease, trachoma, acute respiratory tract infections, atherosclerosis and heart disease
 The present nucleotide sequence is provided in a specification relating to compounds and methods for the treatment and diagnosis of chlamydial infection. The compounds provided include polypeptides and fusion proteins comprising immunogenic portions of Chlamydia antigens and bank sequences encoding such polypeptides. They are useful for vaccinating against chlamydial infection, which causes pelvic inflammatory disease, trachoma, acute respiratory tract infections,

 This DNA sequence codes for a 42 kDa major outer membrane protein (MOMP, see AAW73141) of Chlamydia trachomatis serovar L2. A library of chlamydial genomic DNA was produced in the phage lambda 1059 system. A lambda 1059 recombinant having a 9.2 kD insert was shown to be homologous to lambda gl11/I/L2/33 (see AAW62446) by Southern analysis and was used for endonuclease digestion mapping and additional Southern analyses. 2 Contiguous fragments were identified and these contained sufficient base pairs to encoce the L2 MOMP gene product. These fragments were cloned into M13 for DNA sequencing. Novel recombinant DNA constructs are provided for
 Gaps
 hosts. A claimed probe for detecting C. trachomatis comprises a polynucleotide fragment that specifically hybridises to a DNA or RNA polynucleotide fragment that
 Probe for detecting Chlamydia trachomatis - comprises polynucleotide fragment that hybridises to major outer membrane protein DNA or RNA
 DNA sequencing. Novel recombinant DNA constructs are provided the expression of a polypeptide having immunological activity corresponding to that of a naturally-occurring MOMP of C. trachomatis. Such polypeptides find use as reagents in the detection of C. trachomatis, or antibodies to C. trachomatis, as vaccines against infection by C. trachomatis in susceptible hosts. A claimed probe for detecting C. trachomatis comprises
 DB 19; Length 3133;
 sequence encoding C. trachomatis 38-45 kba MOMP. The probe a sequence which is complementary to at least 12 contiguous of the sequence given in AAV62447.

The present sequence represents DNA encoding the major outer membrane protein (MOMP) of Chlamydia trachomatis serovar L2. DNA obtained from C. trachomatis serovar L2 was partially digested with DNase I and C inserted into the bacteriophage vector lambda-gtll; a lambda-gtll insert (AAZ92752; ATCC #40157, referred to as lambda-gtll/L2/33 in the specification) was obtained which encodes a protein fragment (AAY81267) reactive with a pool of C. trachomatis-specific monoclonal antibodies. The lambda-gtll/L2/33 insert sequence was also used to probe a chlamydial genomic DNA phage lambda 1059 library, and the present sequence which encodes the full-length Chlamydia trachomatis serovar L2 MOMP was identified C. trachomatis is a human pathogen responsible for diseases such as trachoma, inclusion conjunctivitis, pneumonia, inclusion conjunction of antibodies to a MOMP or a fragment thereof is used to elicit the production of antibodies to a MOMP or detecting C. trachomatis or immunoassay reagents (substitutes for native MOMP) for detecting C. trachomatis or inclusion, or as an immunogen for

A new vaccine for Chlamydia psittaci infections

Example 2; Page 47-48; 72pp; English

This DNA sequence codes for a major outer membrane protein (MOMP) polypeptide (see AAW98183) of Chlamydia psittaci strain B577. The MOMP polypeptide comprises regions VD3 and VD4 of native MOMP (see also AAW98188), i.e. it lacks regions VD1 and VD2 of MOMP. DNA encoding the MOMP polypeptide was obtained by PCR amplification (see also AAX25049 and AAX25052) of C psittaci B577 DNA. A claimed fused to a maltose binding protein. Also claimed are an isolated nucleic acid encoding the polypeptide, a vector, and a method of preventing c. psittaci infection by administering the vaccine containing the MOMP polypeptide. Vectors encoding MOMP polypeptides lacking regions VD1 and VD2 are useful for genetic (naked nucleic acid vaccination and vaccines are used to prevent C. psittaci infection, especially in birds.

 optionally fused to a mailtose binding protein. Also failmed are an isolated nucleic acid encoding the polypeptide, a vector, and a method of preventing C. psittaci infection by administering the vaccine containing the MOMP polypeptide. Vectors encoding MOMP polypeptides lacking regions VD1 and VD2 are useful for genetic (naked nucleic acid) vaccination. The vaccines are used to prevent C. psittaci infection, especially in birds.
 This DNA sequence codes for a major outer membrane protein (MOMP) polypeptide (see AAW98183) of Chlamydia psittaci strain LSUWTCK, cockatiel isolate (the MOMP gene sequence of this isolate is identical to that of C. psittaci Avian Type C). The MOMP polypeptide comprises regions VD3 and VD4 of native MOMP (see also AAW98187), i.e. it lacks regions VD1 and VD2 of MOMP. DNA encoding the MOMP polypeptide was obtained by PCR amplification (see also AAX25049 and AAX25051) of C. psittaci LSUWTCK DNA. A claimed vaccine composition includes this MOMP polypeptide.

Human LYST1 longer isoform.

RESULT 14

AAW31950

```
(17571) Polypeptide (Compissors a tysowomen tential required.)

(17571) Polypeptide (Compissors a tysowomen tential required.)

(17571) In mutated in several chediak-Higashi syndrome (CHS) patients.

(17571 long isoform can be expressed in host cells using an isolated tysomomen (See AAP74201) for use in various pharmacological and munological applicatins. A shorter LYST1 isoform (see AAW23597).

(17571 long isoform can alternative splicing, has also been identified.

(17571 regulates degranulation of lysosomes, late endosomes and acidic secretory granules, primarily in leukocytes. Inhibition of such degranulation using dominant negatively acting truncated LYST1 peptides may be used to treat inflammatory bowel disease, systemic lupus of asthma, urticaria, inflammatory bowel disease, systemic lupus carthmanatous, rheumatoria arthritis, psoriasis, systemic vasculitis, concernosis, while LYST1 peptides that mimic or augment LYST1 function may be used to treat neoplasia.
 LVST1; human; lysosomal trafficking regulator; chediak-Higashi syndrome; CH syndrome; autoimmune disease; tumour; asthma. urticaria; inflammatory bowel disease; psoriasis; systemic lupus erythematosus; rheumatoid arthritis; systemic vasculitis; glomerulonephritis; multiple sclerosis; post-angioplasty restenosis; vaccine; therapy; diagnosis.
 Mammalian lysosomal trafficking regulators LYST1, Lyst1, LYST2 and
Lyst2 – useful to diagnose Chediak-Higashi syndrome
 protein sequence comprises a lysosomal trafficking regulator

```
This polypeptide is encoded by an alternatively spliced transcript of the human beige (bg) gene (see AAT89257). The amino acid sequence of the human beige (bg) gene (see AAT89257). The amino acid sequence of the predicted by gene product indicates that the protein is covel. A longer, putatively full-length by transcript (see AAT89256) encodes, a 3801-amino acid protein (see AAW3144). The by gene product is involved in the normal differentiation and/or function of intracellular vesicles. Mutation of the human by gene is responsible for human Chediak Higashi syndrome (CHS). An intracellular vesicle disorder, specifically CHS, can be diagnosed by measyring by gene expression in a patient sample, e.g. by measyring by gene expression in a patient sample, e.g. by gene[mutation contained in the genome of the mammal, specifically in a splice site of the by gene (claimed). Genetically sepecifically in a splice site of the by gene (claimed). Genetically contained in the compounds useful contained in the send for compounds useful.

Che the treatment of intracellular vestcle disorders, specifically contained in a mammal (claimed).

 by Holicobacter pylori. The vaccine contains at least one isolated H. pylori polypeptide, or its fragments, in a carrier, where the carrier is a Salmonella, vibrio cholerae or Shigalla vector containing a nucleic acid encoding the H. pylori polypeptide. The vaccines induce humoral and cellular immune responses. The vaccines are used to treat or prevent infections by H. pylori. Sequences AAX75779 to AAX75837 represent nucleic acid sequences encoding H. pylori outer membrane polypeptides (OMPs) AAX17160 to AAX17218.

 family member (isp4-like protein) from Arabidopsis thaliana, designated emb (AB43855.1. Members of the OPT family have been identified in yeasts and plants. The invention relates to a novel OPT of Saccharomycose cerevisiae, designated opr1 (see AAY96149). OPT is the first example of a genetically defined eukaryotic transport protein which can transport enkephalins across the cell membrane. Vectors allowing expression of the OPT1 gene, transgenic plants, and treatment of OPT1 with toxic enkephalins as an antifungal method are claimed. Also claimed is a method for obtaining mammalian enkephalin transporters by functional complementation of OPT1 deficient yeast.

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMD42 (gil4732114) iplah29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for amplicillin resistance."

Chlamydia trachomatis mviN homolog, lorf2; possible membrane-bound
protein, and 76 kDa protein homolog genes, complete cds.
 Kemp, D.J. and Sriprakash, K.S.
Expression of two novel proteins in Chlamydia trachomatis during
natural infection
 Myers,G.S.A. and Sriprakash,K.S.
Direct Submission
Submitted (05-MAR-1996) Molecular Genetics Unit, Menzies School
Headalth Research, Rocklands Drive, Darwin, NT 0810, Australia

 The present sequence is a DNA coding for a fusion protein comprising truncated Chlamydia pneumoniae 76 kDa protein and vector-encoded residues. C. pneumoniae 76 kDa protein is used in the diagnosis, prevention and treatment of C. pneumoniae infections (e.g. pneumonia, upper respiratory tract disease, bronchitis, sinusitis and acute respiratory diseases such as cough, sore throat, hoarseness, fever; and abnormal chest sounds on auscultation). C. pneumoniae sequence is also used as vaccines for immunising humans against diseases

 The present sequence represents the complete genome of Chlamydia pheumoniae, and encodes proteins AAY3584-Y35879. C. pneumoniae causes respiratory disease such as pneumonia and bronchits and is thought to be a contributing factor in heart disease, sarcoidosis, sinustis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.

 acids encoding a 76 kDa protein from Chlamydia pneumoniae, for vaccinating against Chlamydia infections
 protein is used in the diagnosis, prevention and treatment of C. pneumoniae diagnosis, prevention and treatment of C. pneumoniae infections (e.g. pneumonia, upper respiratory tract disease, bronchitis, sinusitis and acute respiratory diseases such as cough, sore throat, harseness, fever; and abnormal chest sounds on auscultation). C. pneumoniae sequence is also used as vaccines for immunising humans against diseases

 This sequence encodes lorf2 protein of a strain of chlamydia pneumoniae. Comparison of this sequence as to the recently published genome sequence of C. pneumoniae reveals that the sequence actually contains at least two open reading frames, a first one in the 5' portion and a second one in the 3' portion of the sequence. Despite the presence of the stop codon at the end of this sequence. C. pneumoniae does make a 76 kba product. It appears possible that C. pneumoniae is able to read through this stop codon and produce a full-length product terminated by the stop codon at the end of the second open reading frame. There is at least one in-frame ATG upstream of the start codon. This suggests that the first open reading frame may form part of one or more larger open reading frames. The lorf2 protein or DNA can be used as a vaccine for humans to treat or prevent disease caused by chlamydia infection. The sequences or an antibody to lorf2 can be used to diagnose a chlamydial infection.

vectors by inserting the G protein gene into a non-replicating vector. The G protein is placed under the control of alternative vector. The G protein is placed under the control of alternative signal and expression sequences, for example the chimeric G protein produced may also comprise the signal peptide of tissue plasminogen activator (tPA). The recombinant vector may also comprise sequences immunoprotective ability. The resulting immunogenic composition will generate antibodies directed against the RBV G protein when common to a host organism. The composition is useful as a vaccine to immunise against RBV-associated disease, particularly resulting in a balanced ThI/TH2 immune response and for raising Ab, by usual immunisation and cell fusion methods. VR-1012 is a recombinant vector comprising the immediate-early cytomegalovirus and cell by promoter and Intron A sequences of human cytomegalovirus and the bovine growth hormone poly A site. The VR-1012 vector was used as a basis for the creating immunogenic expressing the RSV G protein. Two resulting vectors designated pxL5 have been deposited with the American Type Culture Collection (ATCC 209143 and ATCC 209144 respectively).
 Immunizing a host against diseases caused by respiratory syncytial virus (RSV) infection comprises administering a non-replicating vector \,

This invention describes a novel method for immunizing a host against diseases caused by infection with RSV which comprises administering a plasmid vector comprising a nucleotide sequence encoding an RSV F protein generates antibodies and/or cytotoxic cray and a promoter sequence operatively coupled to the nucleotide sequence. The RSV F protein generates antibodies and/or cytotoxic cray in that specifically react with the RSV F protein. The method is useful for administering RSV vaccines to seronegative infants. The method is useful for administering RSV vaccines to seronegative infants. The munogens in diagnostic applications. The RSV F genes and vectors are also useful as immunogens for the generation of anti-F antibodies for use in immunogens (e.g. enzyme linked immunosorbent assay (ELISA), cradioimmunosasy (RLA) or other non-enzyme linked antibody be proven to be poorly immunogenic with regard to the induction of neutralizing cassays). Prior methods of administering RSV vaccines have proven to be poorly immunogenic with regard to the induction of neutralizing cause disease enhancement or immunopotentiation, and have the risk of residual virulence and genetic instability. In the present method, the continody to the virus itself, without loss of potency due to neutralization of virus by the antibodies. The antibody to the virus itself, without loss of potency due to exhibits a native conformation. Therefore, it induces an antibody response similar to that induced by the antigen present in the wild-type virus infection. The expression of proteins from injected plasmid DNA can virus infected by the antigen present in the wild-type wild and the serior of virus is administration of expression of proteins from injected planting virtual entities is a partial and present in the expression of virus infection. The expression of proteins from injected planting virtual entities is a partial and present in the present in the virus infection. The expression of proteins from injected planting virtual and present in the pre
 virus infected cells. This is advantageous since it prolongs cytotoxic T-cell induction and enhances antibody responses. The in vivo expression of antigen may also provide protection without the need for an extrinsic adjuvant. This sequence the encoding DNA sequence of the plasmid VR-1012 which is used in the method of the invention.

 New polypeptide variants of growth hormone releasing hormone with enhanced resistance to enzymatic degradation, useful for treating growth hormone deficiency related disorders or to improve growth and
 The present invention relates to growth hormone-releasing hormone (GHRH) variants having enhanced resistance to enzymatic degradation. The variant GHRH polypeptides can be administered to animals to treat growth hormone deficiency related disorders, or to improve growth and/or performance. The variants can be included in pharmaceutical compositions to promote expression and elevation of growth hormone. The variants can be produced recombinantly at much higher levels than prior art variants modified using traditional chemical methods: They have enhanced resistance to enzymatic degradation, therefore have increased length of activity.

performance

The present invention relates to growth hormone-releasing hormone (GHRH) variants having enhanced resistance to enzymatic degradation. The variant GHRH polypeptides can be administered to animals to treat growth hormone deficiency related disorders, or to improve growth and/or performance. The variants can be included in pharmaceutical compositions to promote expression and elevation of growth hormone. The variants can be produced recombinantly at much higher levels than prior art variants modified using traditional chemical methods. They have enhanced resistance to enzymatic degradation, therefore have increased length of activity.

Determination of this BAC-end sequence was carried out as part of

Determination of this BAC-end sequence was carried out as part of

collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila

melanogaster genome using these BACs. For further information

please see http://www.fruitfly.org The BDGP Drosophila

melanogaster BAC library was prepared by Kazutoyo Osoegawa and

Aaron Mammoser in Pieter de Jong's laboratory in the Department of

Cancer Genetics at the Roswell Park Cancer Institute in Buffalo,

WY. The library is named RPCI-98 and was constructed by partial

ECORI diseation of Drosophila DNA provided by the BDGP from the

isogenic strain v2; cn bw sp, the same strain used for the BDGP's

pl and EST libraries. A more detailed description of the library

and how to order individual BAC clones, the entire library, or

filters for hybridization from the BACPAC Resource Center can be

cound at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 Shirai, M., Hirakawa, H., Kimoto, M., Tabuchi, M., Kishi, F., Ouchi, K., Shiba, T., Ishii, K., Hattori, M., Kuhara, S. and Nakazawa, T. Comparison of whole genome sequences of Chlamydia pneumoniae J138 from Japan and WLW1029 from USA
 Shiral, M.

Direct Submission

Submitted (04-JUL-2000) to the DDBJ/EMBL/GenBank databases.

Submitted (04-JUL-2000) to the DDBJ/EMBL/GenBank databases.

Nutsunori Shiral, Yamnguchi University School of Medicine,

Department of Microbiology; 1-1-1 Minamikogushi, Ube, Yamaguchi
75-805, Japan (E-mail:mshiraidepor cc. yamaguchi. u.ac.jp,

Tel:81-836-22-2227, Fax:81-836-22-2415)

On Sep 15, 2000 this sequence version replaced gi:617298

gi:617230 gi:6172396 gi:6172398 gi:8978889.

AB033786-AB033787, AB033816-AB033817: Submitted (25-Oct-1999).

 AC015625 143364 bp DNA HTG 26-MAY-2000
Homo sapiens clone RP11-45J21, WORKING DRAFT SEQUENCE, 7 unordered
 Submitted (17-NOV-1999) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA On May 26, 2000 this sequence version replaced gi:6624051.
All repeats were identified using RepeatMasker:
Smit, A.F.A. & Green, P. (1996-1997)
Altrp://frp.genome.washington.edu/RM/RepeatMasker.html
 Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

Quality coverage: 4.7 in Q20 bases; agarose-fp
Quality coverage: 4.8 in Q20 base
* NOTE: This is a 'working draft' sequence. It currently
* consists of 7 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

while the transfer of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (1.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, GAISSENCT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP databases can be found at the found at the found at the contigs of human was generated from part of bacterial clone contigs of human was generated from part of bacterial clone contigs of human and the found at the contigs of human and the found at the contigs of human and the found at
 chromosome \mathbf{X}, constructed by the Sanger Centre Chromosome \mathbf{X} Mapping Group. Further information can be found at
 derived from a single pUC clone. Restriction digest data confirm the assembly. Sequence from uni-directional primer reads only."
 http://www.sanger.ac.uk/HGB/ChrX
BY11-172M3 is from the library RPCI-11.1 constructed by the group of Pleter de Jong. For further details see http://www.chori.org/bacpac/home.htm
VECTOR: pBACG3.6
This sequence is the entire insert of clone RPI1-172M3 The true left end of clone RPI1-55869 is at 135984 in this sequence. The true right end of clone RPI1-417G14 is at 98898 in this sequence.
 During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations

 FEATURES
 only a small overlap as described above.
This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality) = 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one Mi3 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em., EMBL; Sw.; SWISSPROT; Tr., TREMBL; Wp., WORNDEP; Information on the WORNDEP
 Submitted (09-MAR-2001) Sanger Centre, Hinxton, Cambridgeshire, CB10 ISA, UK E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk clone requests: clonerequest@sanger.ac.uk clone requests: clonerequest@sanger.ac.uk clone requests: clonerequest@sanger.ac.uk clone by this sequence version replaced gi:4584645.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with

                                                                  This sequence encodes lorf2 protein of a strain of Chlamydia pneumoniae. Comparison of this sequence as to the recently published genome sequence of C. pneumoniae reveals that the sequence actually contains at least two open reading frames, a first one in the 5' portion and a second one in the 3' portion of the sequence. Despite the presence of the stop codon at the end of this sequence. C. pneumoniae does make a 76 kba product. It appears possible that C. pneumoniae is able to read through this stop codon and produce a full-length product terminated by the stop codon at the end of the second open reading frame. There is at least one in-frame ATG upstream of the start codon. This suggests that the first open reading frame may form part of one or more larger open reading frames. The lorf2 protein or DNA can be used as a vaccine for humans to treat or prevent disease caused by Chlamydia infection. The sequences or an antibody to lorf2 can be used to diagnose a Chlamydial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1135

                                                                                                      The present sequence represents the complete genome of Chlamydia pneumoniae, and encodes proteins AAY34584-Y35879. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        829363 ATGACAAAAAAACATTATGCTTGGGTTGTAGAAGGGATTCTCAATCGTTTGCCTAAACAG 829304

                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  acagaaaaagctgctacaaacgctatgaaatacaaatactgtgtttggcagtggctcgtc 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ttttttgtgaaatgtagtgttgtcgactggaacacattcgttccttcagaaacctccact 120

   The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    acagaaaaagctgctacaaacgctatgaaatacaaatactgtgtttggcagtggctcgtc
